

Assignment 2 Write Up

Runjia Tian

Algorithmic Acceleration:

Three various methods for calculating vector-triangle intersection:

Results of Fast Voxelization:

2.3 Results of Non-Watertight Mesh Voxelization

Algorithm: Project Original Boundingbox to a new base plane, and project along projection vectors from the new base plane grid; calculate intersection points, and inversely calculate nearest voxel centers to the intersection points, and fill voxels with true between intersection points in original voxel grids.

The Pickachu model with holes

Results of Running Marching Cube
